- ActiveX Component - .NET Framework 2.0 C#, VB.NET, F#, C++ development. The ActiveX component not only supplies the ability to play the audio files, but also functions as an API for plugins as well as manages the installation and removal of the codecs. - ActiveX Control - .NET Framework 2.0 C#, VB.NET, F#, C++ development. Comes in three forms: a Windows Media Component, the Windows Media Control, and the Windows Media Player Control. Each control is optimized to a particular type of playback. The Windows Media Component is used to play a broader array of audio files than any other control. The Windows Media Control is designed to control the media playback with a mouse and optionally interface to digital camera or scanners. The Windows Media Player Control, like the Media Component, is able to play a broad range of audio files, however, it includes a lot of built-in features that save time and make media controls easy to use. - Command-Line Interface (CLI). This method provides the ability to play audio in-line with other commands. It uses a command interpreter to convert between the Windows command system and a proprietary command system that is suitable for the codecs. - Library Package. This method packages up the codecs and registers a custom extension handler. The extension handler converts between Windows file extensions and the codecs when reading or playing a file. - MSI Installer. Install via MSI. - Setup Files. Exe and ISX files that can be copied to any directory, run a console installer, or install via the Windows Installer. One option allows you to install the package to an existing folder.
