Q: How do I make a cron job to transfer files to Amazon S3 bucket using s3sync? I know this question has been asked several times but I am really really new to Ubuntu and I cannot get this to work for me. I need to create a cron job that copies/uploads files to Amazon S3 bucket. I have tried some things using s3sync and that did not work for me. My command so far was: s3sync config-file ~/s3sync/cfg.json /media/NEW/s3.txt When I run the command manually, it works fine and transfers the files to the bucket. However, when I create a cronjob using crontab -e and paste the above command, it says: > s3sync config-file ~/s3sync/cfg.json /media/NEW/s3.txt Would you like to upload the file(s) /media/NEW/s3.txt? [y/n] y No such bucket

By Kerrie Fuller Meyler SCOM helps you keep track of your entire IT environment.The present invention relates to a method for image processing, and more particularly, to a method for the accurate image processing of a thin slice for angiography with the minimum amount of artifacts. In a typical cerebral angiography, a contrast medium is injected into a patient's body via an injection port to thereby visualize a cerebral blood vessel and the vascular system. In particular, the intensity of the blood flow is considerably high in an aneurysm so that a thin section is required for the observation of the blood flow. A. G. Lasjaunias, an expert in contrast angiography, presents typical examples of human motion artifacts, for example, in picture 1 of his paper entitled "Angiographic Image Quality: A Review of Causes of Image Degradation and Methods for their Reduction," published in the American Journal of Roentgenology, vol. 135, pp. 379-392, 1986. Specifically, from the representative picture 1, it is seen that motion artifacts are produced in the subject's head. A patient's head is usually fixed in an angiography system. In picture 2 of his paper, Lasjaunias presents an image of a head, which was taken before moving the
